Task-level PASS rates by task category

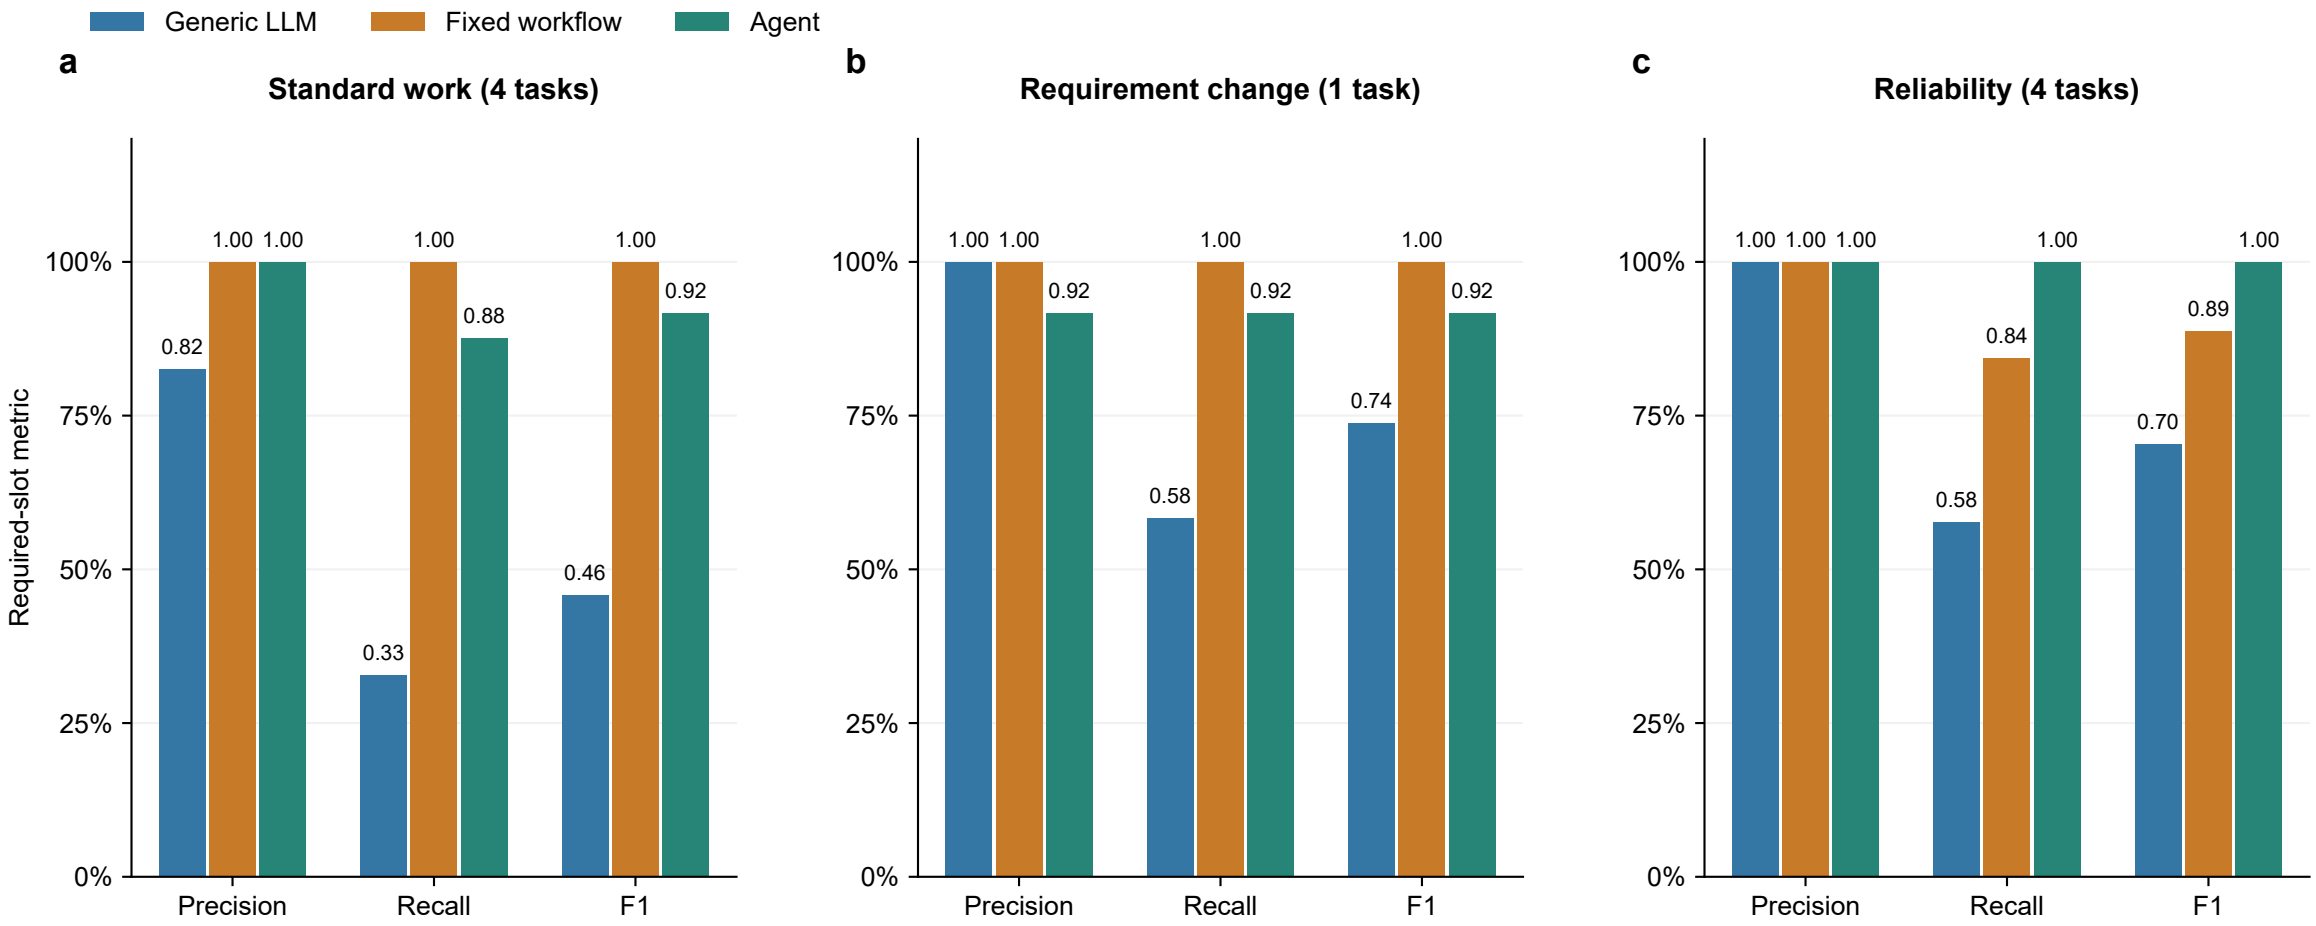

Initial AI task labels and the recorded project adjudication overlay

Task units are paired across configurations; no task was rerun. The single change case cannot establish general performance.
The overlay is retrospective project adjudication, not independent blind validation.

Required-slot macro metrics by task category

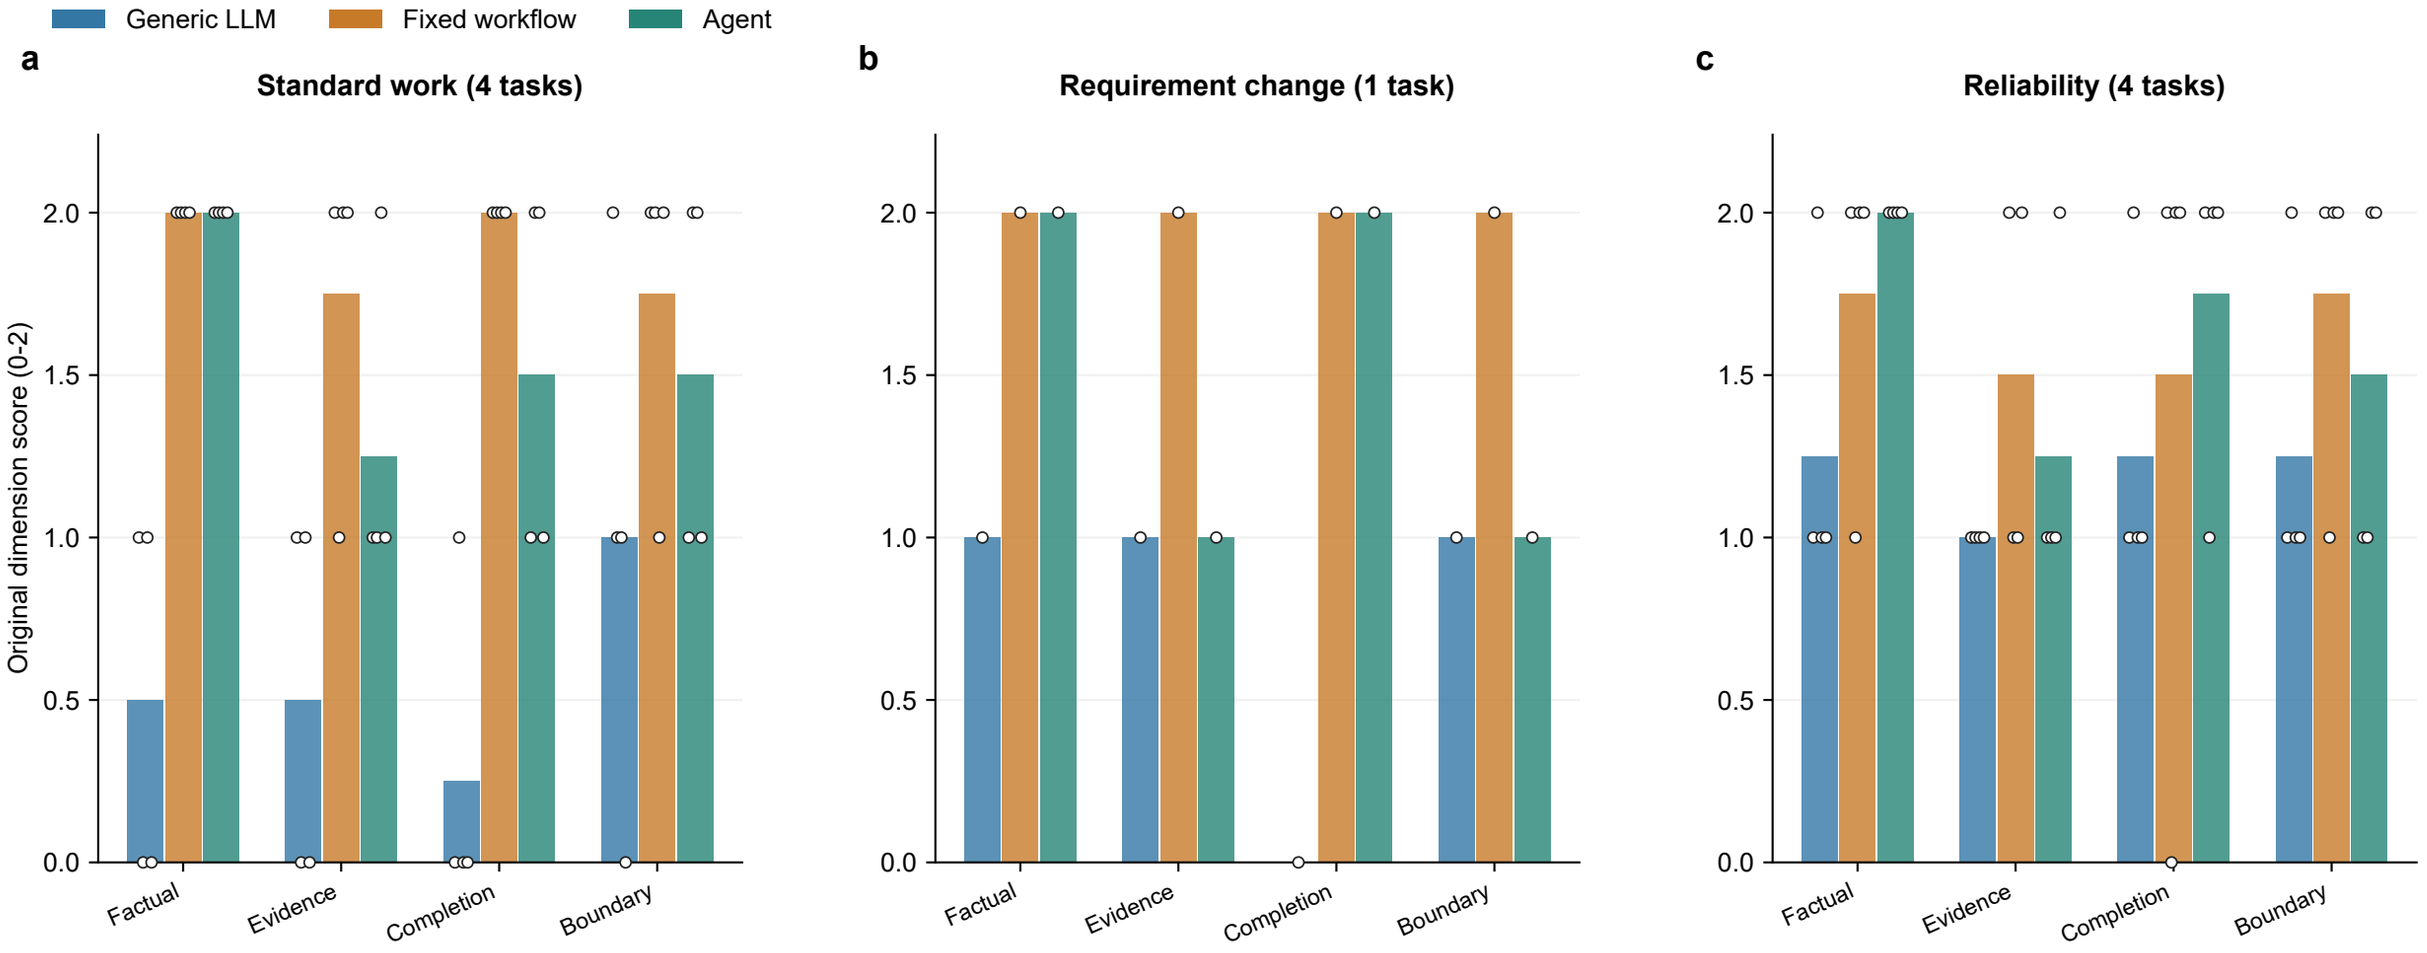

AI-provisional slot labels, unchanged by the task adjudication overlay

Macro = arithmetic mean of the per-task metric; the change panel has one task per configuration.
CORRECT -> TP; WRONG -> FP and FN; MISSING -> FN. No biological efficacy or strict C1 planning claim.

Original dimension scores - sheet A

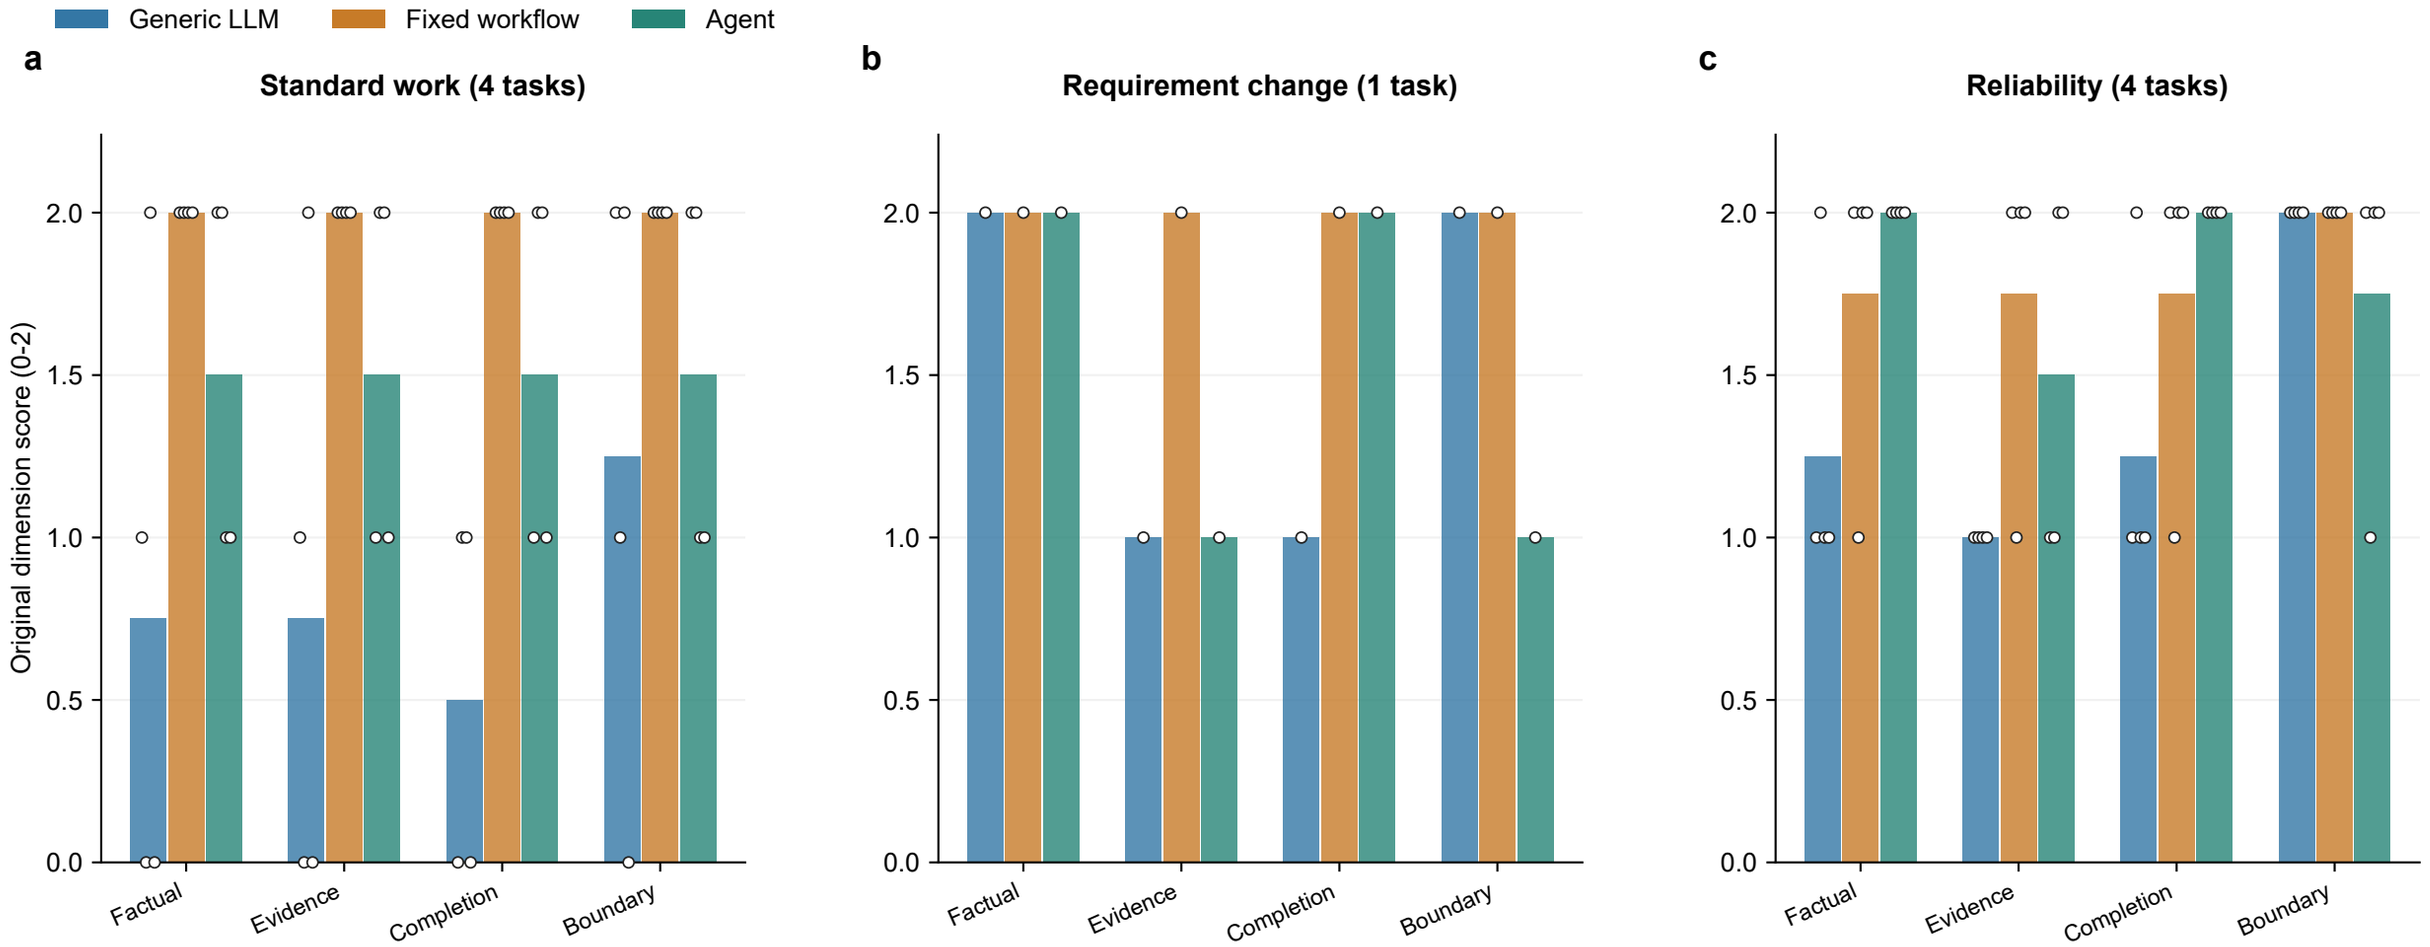

Score sheet A is kept separate; no dimension score was changed by adjudication

Bars show means on the original 0-2 scale; dots show each task rating. No fabricated error bars or significance tests.
These are descriptive scores of prepared-input development configurations, not knockdown accuracy or user-experience measurements.

Original dimension scores - sheet C

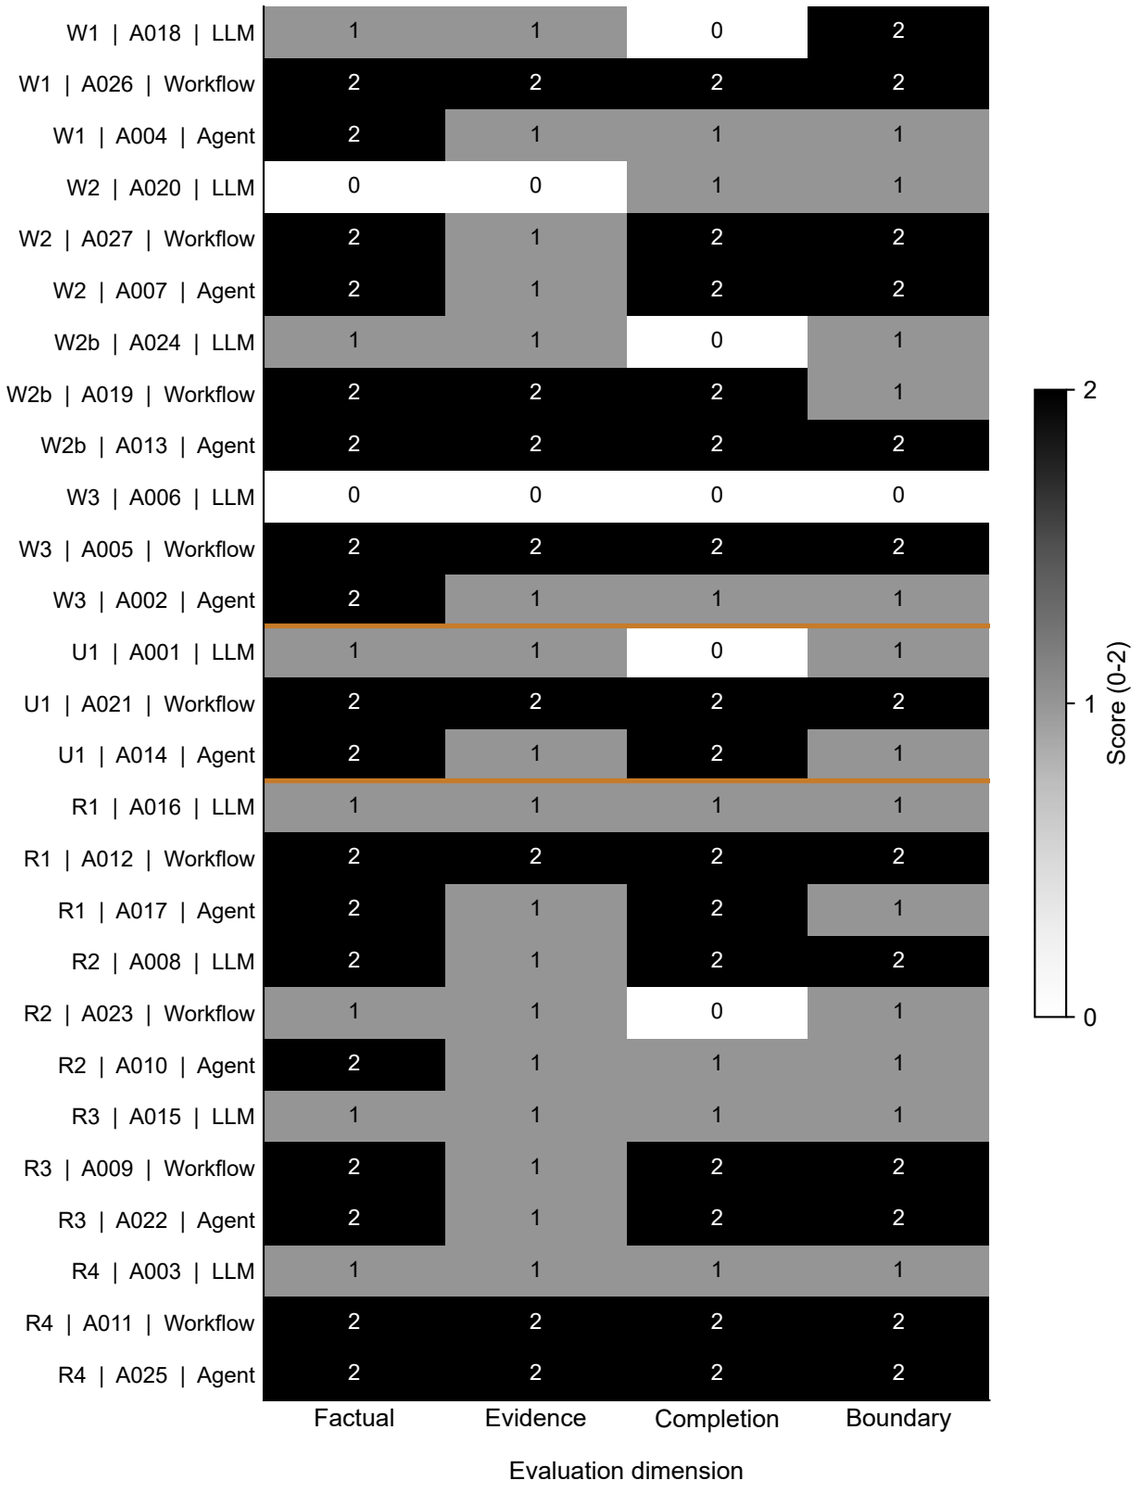

Score sheet C is kept separate; no dimension score was changed by adjudication

Bars show means on the original 0-2 scale; dots show each task rating. No fabricated error bars or significance tests.
These are descriptive scores of prepared-input development configurations, not knockdown accuracy or user-experience measurements.

Complete task-by-dimension score matrix - sheet A

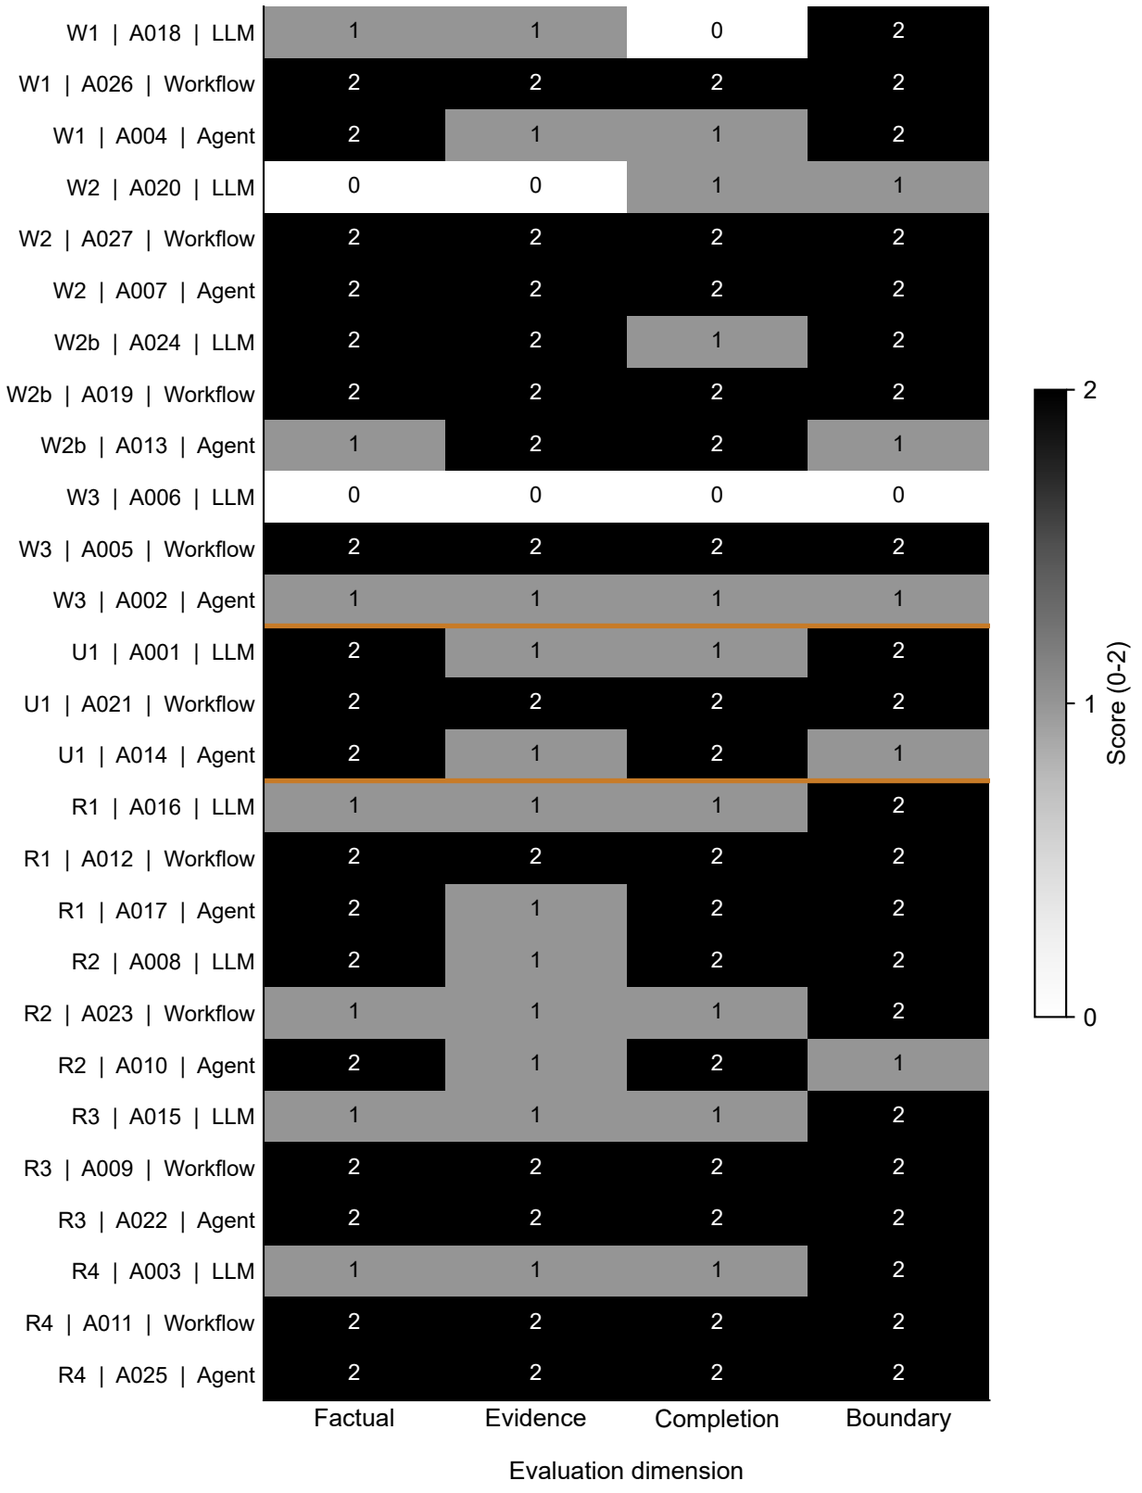

All 27 original rating records; three configurations of nine seen task templates

Rows are ordered as standard work, requirement change, and reliability; separators mark category boundaries.
Original sheet scores are preserved. Sheet A and C are not pooled or counted as independent replicate experiments.

Complete task-by-dimension score matrix - sheet C

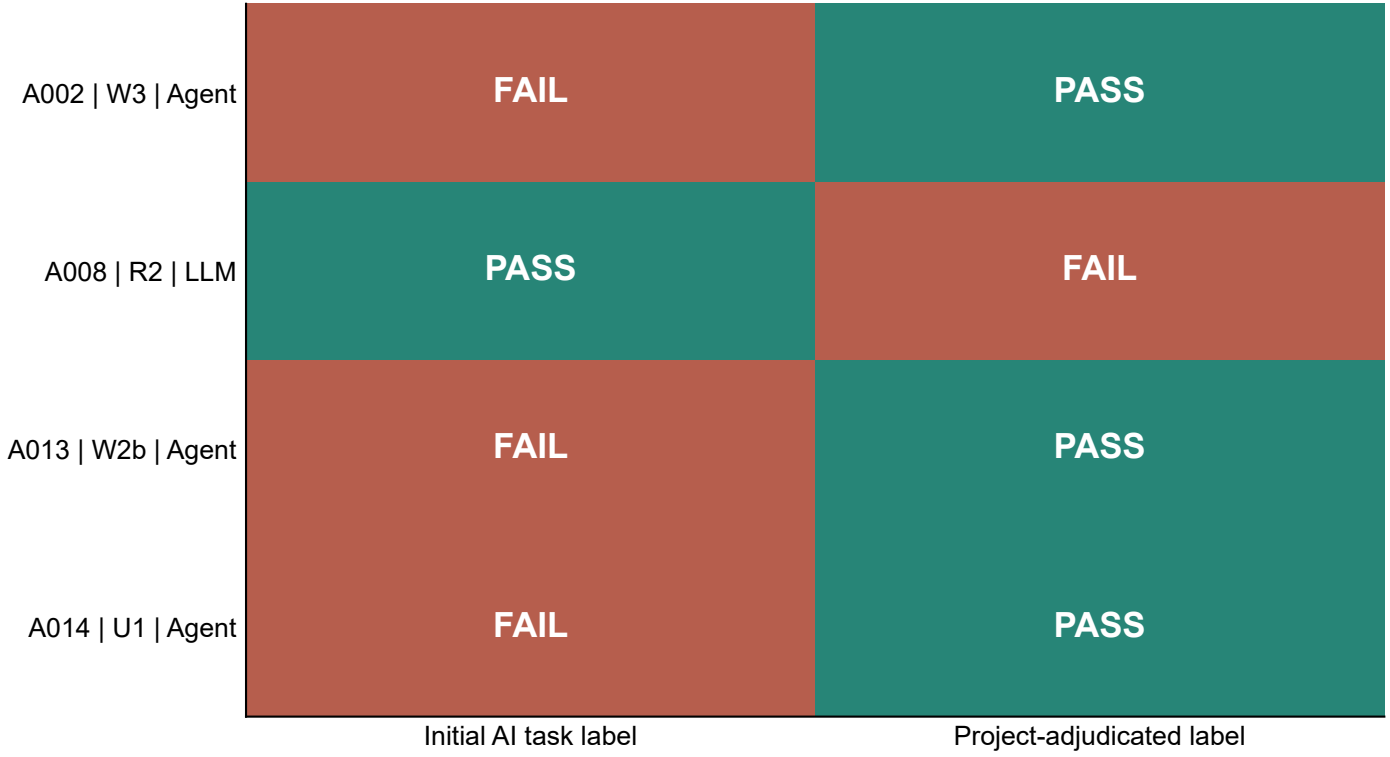

All 27 original rating records; three configurations of nine seen task templates

Rows are ordered as standard work, requirement change, and reliability; separators mark category boundaries.
Original sheet scores are preserved. Sheet A and C are not pooled or counted as independent replicate experiments.

Four task labels changed by project adjudication

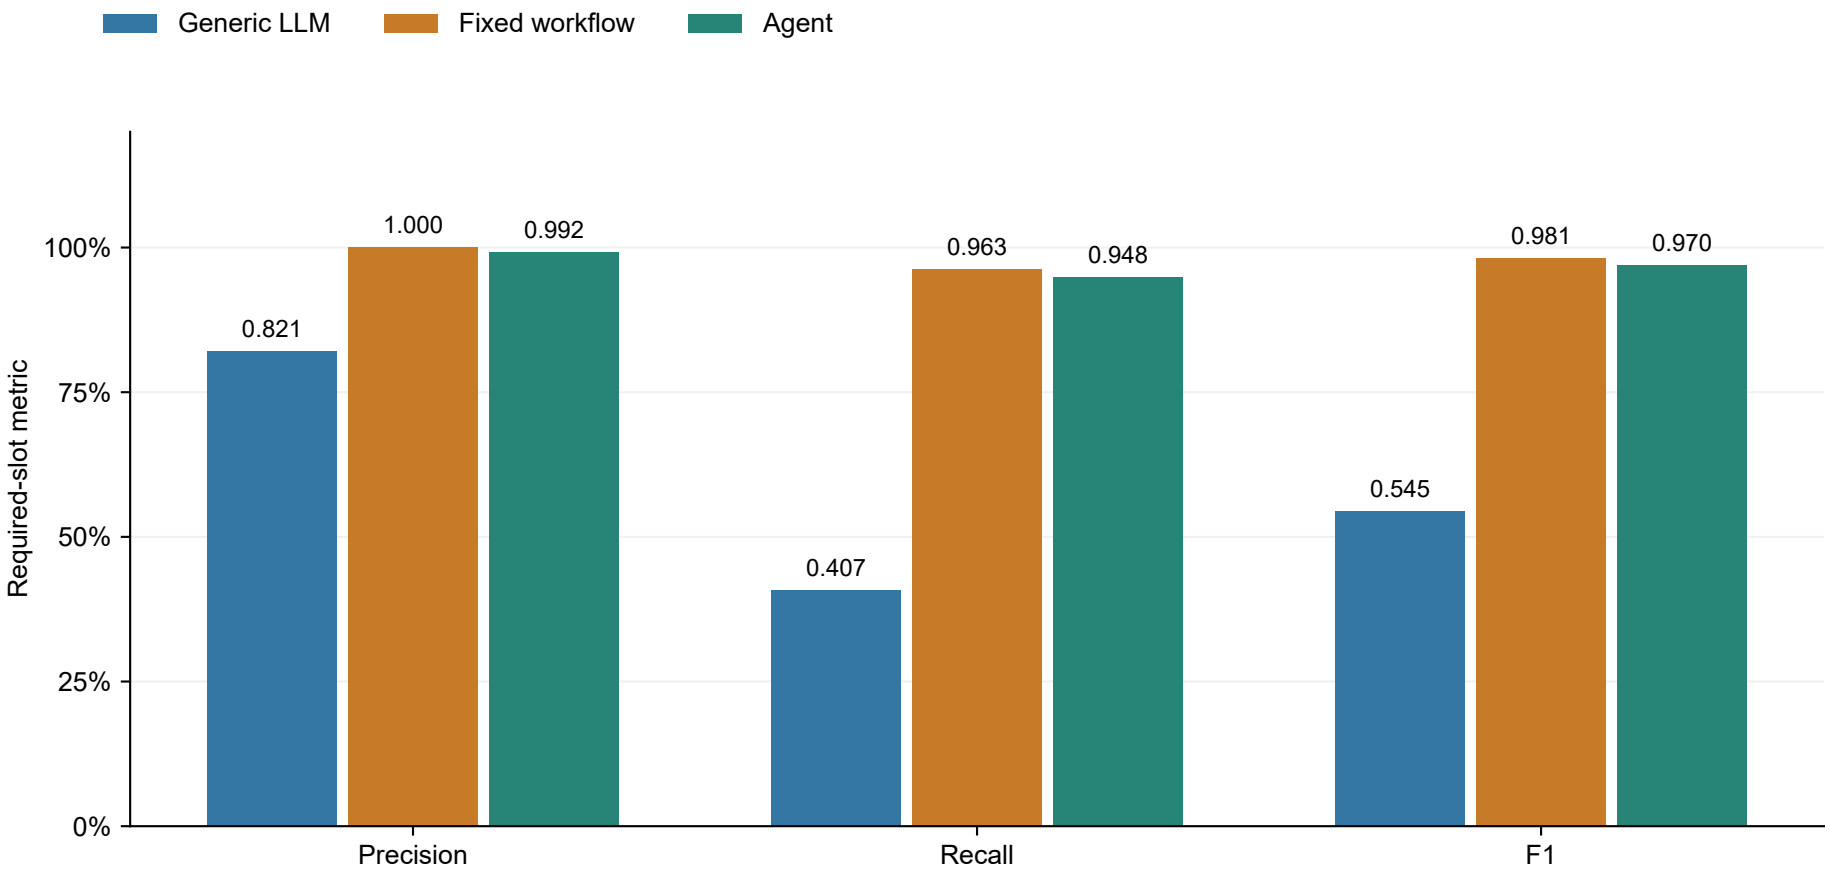

The other 23 task labels are unchanged; all 405 slot labels and both score sheets remain unchanged

A002/A013/A014: FAIL to PASS. A008: PASS to FAIL. This is a versioned retrospective decision overlay.
The changed task labels do not make previously wrong/missing slots correct and do not establish unseen-task performance.

Overall required-slot micro metrics

AI-provisional slot labels, unchanged by the task adjudication overlay

Supplementary pooled description: 9 seen tasks and 135 required slots per configuration.
CORRECT -> TP; WRONG -> FP and FN; MISSING -> FN. No biological efficacy or strict C1 planning claim.
