a

Adapted workflow: human VEGFA / ARPE-19

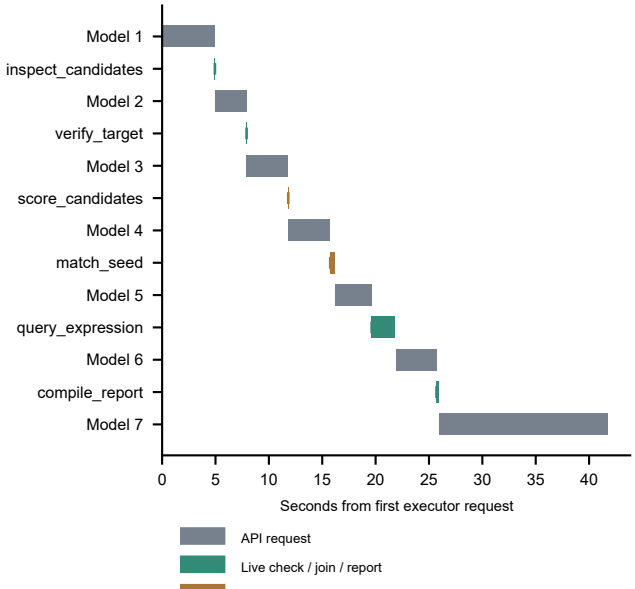

b

Migration scope from CRISPR-GPT

Source-paper concept	This project	Evidence boundary
Meta / Auto / Q&A	Implemented	Single API + controlled tools
Planning / tool evidence	Real Auto archived	Six tools; mixed live checks and imports
Benchmark / expert review	Development only	6 tasks × 3 arms × 3 technical repeats
Fine-tuning / wet lab	Not performed here	No equivalence to the full source system

a **Actual Auto execution trace**

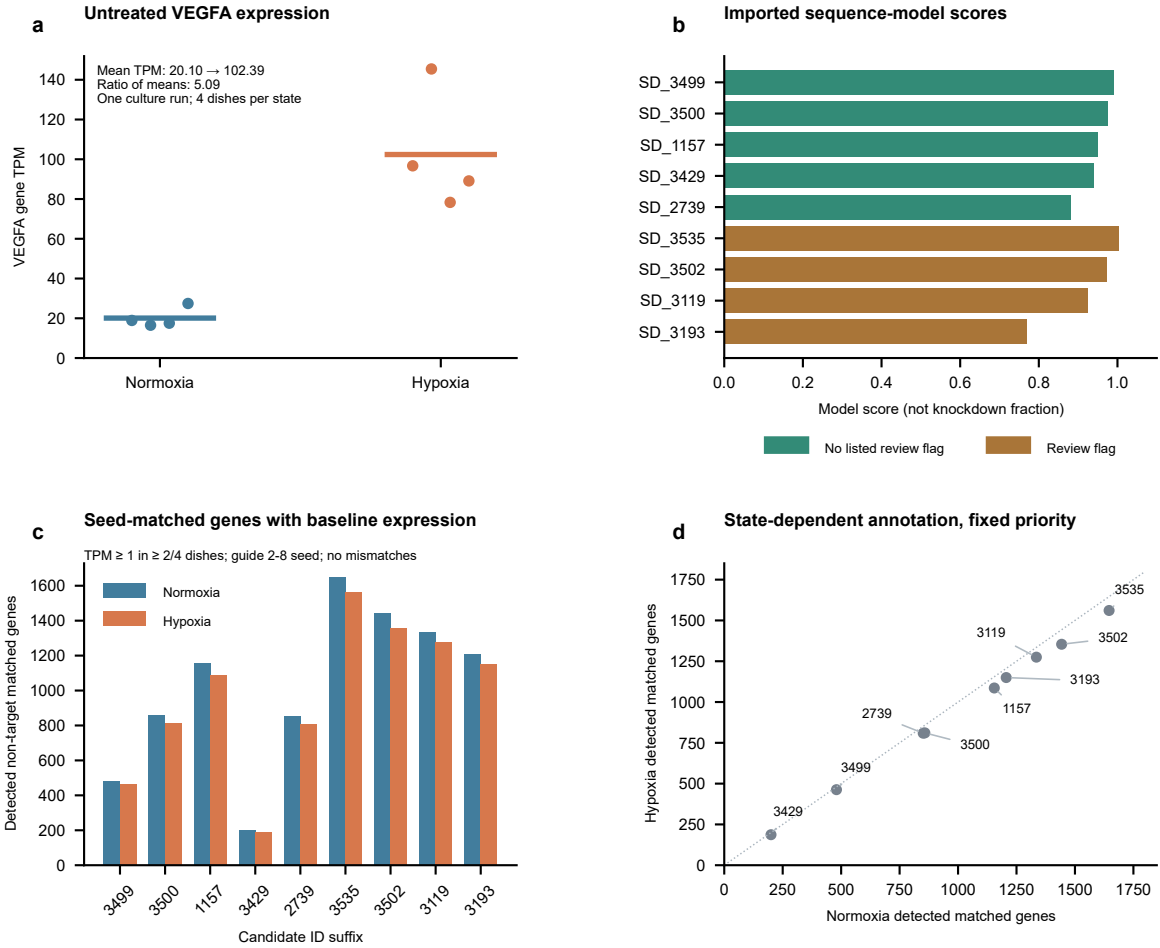

b **Input → evidence → output**

VEGFA; 9 siDirect candidates
ARPE-19 hypoxia: 1% O2, 24 h
Requested top 2; external web disabled

6 / 6 planned scientific tools recorded
Live reference check + historical model / seed
Live expression join; 9 evidence rows agree

Priority for review: SD_3499 / SD_3500
Not order-ready; not measured knockdown
Planner usage absent; total tokens unknown

Archived run 20261020_064921_2dae59; runtime e53bacb. Executor returned subtotal = 59,767 tokens; planning latency / usage not reconstructed.

Expression annotates candidate context and does not change ranking. Counts are potential seed matches, not measured off-target effects; no paired design or treatment effect.
