a User question (translated)

Can an OligoFormer score above 1 mean more than 100% knockdown?

b Evidence actually passed to the model

[S3] Article full text, text-c020

"The output of the model represents a prediction score for each siRNA, reflecting its potential effectiveness in inducing gene knockdown."

OligoFormer, DOI: 10.1093/bioinformatics/btae577

[S2] Official source code, text-c007

```
Y_PRED = [i*1.341 for i in Y_PRED]
RESULT['efficacy'] = Y_PRED
```

scripts/infer.py @ e2f53ad63387 (also retrieved in S5)

[S1] Project setting (translated, not a paper result)

"The model score is not an experimental knockdown percentage."

c Answer (translated excerpts)

No.

A score above 1 cannot mean more than 100% knockdown. [S1, S3]

The output is linearly scaled by 1.341. [S2, S5]

These snippets do not establish a measured knockdown percentage for a specific score.
